

Research & Development

Our research and development (R&D) team at EDM has become widely recognized within the electric utility industry for its problem solving capabilities especially those related to the design, operation, and maintenance of T&D infrastructure. Our capabilities encompass activities ranging from conceptualization of a solution through development and evaluation to commercialization. In addition to the expertise of our engineers, scientists and technicians we pride ourselves on the ability to offer our clients seamless, cost-effective access to world-class experts on specialized technologies through our long established collaborative relationships with leading research institutes, universities and consultants. Typical R&D engagements focus on technologies, products and services for analyzing, monitoring and/or optimizing the life, reliability, condition and capacity of T&D facilities and other existing infrastructure.

- Product development
- Analysis methods
- Sensor and communication technologies
- Product testing, evaluation & qualification
- Technical guides, specifications & publications
